Relativistic Non Hermitian Quantum Mechanics

Quantum mechanics is a fundamental theory in physics that provides a description of the physical properties of nature at the scale of atoms and subatomic particles.: 1.1 It is the foundation of all quantum physics including quantum chemistry, quantum field theory, quantum technology, and quantum information science. Classical physics, the description of physics that existed before the theory ...

The Hilbert space of a composite system is the Hilbert space tensor product of the state spaces associated with the component systems (for instance, J. M. Jauch, Foundations of quantum mechanics, section 11.7). For a non-relativistic system consisting of a finite number of distinguishable particles, the

a quantum canonical transformation, just as in the non-relativistic case. The developments of this section leads directly to the KvN theory for a relativistic (spinless) particle. Section 5 is devoted to show the close relation of the operational theory constructed in the previous sections with relativistic Hamiltonian mechanics.

The theory of non-Hermitian systems and the theory of quantum deformations have attracted a great deal of attention in the last decades. In general, non-Hermitian Hamiltonians are constructed by a ad hoc manner. Here, we study the (2+1) Dirac oscillator and show that in the context of the η -deformed Poincaré-Hopf algebra its
