This work considers the problem of stabilization of nonlinear systems subject to constraints, uncertainty and faults in the control actuator. We first design a robust model predictive controller that allows for an explicit characterization of the set of initial conditions starting from where feasibility of the optimization problem and closed-loop stability is guaranteed. The main idea in ...

Robust constrained model predictive control

1. Introduction 1.1. General Outline. Model predictive control (MPC) technology is a mature research field developed over four decades both in industry and academia addressing the question of (practical) optimal control of dynamical systems under process constraints and economic incentives.

An outlook on robust model predictive control algorithms ...

Abstract: A robust control design is proposed for the lane-keeping and obstacle avoidance of semiautonomous ground vehicles. A robust Model Predictive Controller (MPC) is used in order to enforce safety constraints with minimal control intervention. An uncertain driver model is used to obtain sets of predicted vehicle trajectories in closed-loop with the predicted driver's behavior.

In this paper, a robust model predictive control (MPC) is designed for a class of constrained continuous-time nonlinear systems with bounded additive disturbances. The robust MPC consists of a nonlinear feedback control and a continuous-time model-based dual-mode MPC.

Robust and Adaptive Model Predictive Control of Nonlinear Systems by Martin Guay, Veronica Adetola, Darryl DeHaan Most physical systems possess parametric uncertainties or unmeasurable parameters and, since parametric uncertainty may degrade the performance of model predictive control (MPC), mechanisms to update the unknown or uncertain parameters are desirable in application.

Robust MPC (RMPC) addresses this limitation by optimizing over control policies but at the expense of computational complexity. An alternative

strategy, known as tube MPC, uses a robust controller (designed offline) to keep the system in an invariant tube centered around a desired nominal trajectory (generated online).
